

# What is Medical Tourism?

## Travel within the United States for Medical Care

Travel within the US to have your joint replaced may be appealing for a variety of reasons and has potential advantages compared to seeking care locally. Some people prefer to travel within the US to seek out the care of a specific surgeon in another city or state who has a known reputation for joint replacement or has provided high quality results to friends or family. There are other reasons people travel for joint replacement surgery:

- There may be a specific procedure that is best suited for you but is only performed by a small, select group of surgeons.
- You may need to travel to another city or region where you have family support to assist with your recovery.
- You may be in a rural area that is hours away from your closest orthopaedic surgeon, and travel becomes a necessity for care.
- Occasionally, large companies require their employees to travel to a certain city/hospital for their joint replacement.

Despite potential advantages to traveling for joint replacement, there are also potential drawbacks. If you have a problem immediately after surgery, you may be unable to travel back to your home as you receive further treatment in your surgery destination. It also creates an issue if you develop a problem after surgery once you return home. This creates an awkward situation of either seeking care from a local surgeon who did not perform your surgery or attempting to return to the surgeon who did perform your surgery – which would require further travel.

**We recommend seeking care in your community or in a well-known center close to your community.** If you choose to travel for your joint replacement or are mandated by your employer to do so, we strongly recommend discussing with your surgeon their plan for follow-up visits and how a problem would be managed after surgery.

## Travel outside of the United States for Medical Care

Patients may seek to travel outside of their country of residence to seek medical care. While this practice is less common in the US, some people leave the US to seek medical care for a variety of reasons including cost savings, cultural preferences and family support. While there are potential benefits to medical tourism for some, there are potential downsides depending on the treatment sought and the country to which you travel.

The US Food and Drug Administration (FDA) tightly regulates the production of joint replacement implants and pharmaceuticals within the US to minimize the risk of injury from counterfeit medications or joint replacement parts that are manufactured in an unsafe manner. This is not the case in developing countries where regulations on the medical industry can be lax or nonexistent.

The other major concern with traveling abroad for your joint replacement if you are a US resident is the potential for a problem after surgery. If you undergo a joint replacement in another country and then return to the US and develop a problem, you either must return to your surgeon in the other country or seek care in your community. This is a difficult situation for you and the local surgeon who is now being asked to take responsibility for a surgery they did not perform.

**If you are a US resident, we recommend remaining in the US for your joint replacement due to these concerns.**
